

- A safe escape route The unique and safe rescue ladder

The MODUM escape ladder is unique. When not in use it is discrete and sits closed on the wall. In an emergency it will open in a matter of seconds using a release pin. If the house consists of several floors, a release station can be placed on each floor. The ladder can then be opened from each floor – but only downwards. If the ladder is released from, for instance, the 3rd floor, it can still be released from upper floors down to the 3rd floor, where it will connect to the remainder of the ladder. As it is not possible to open the ladder from the ground, it is not possible for an intruder to climb the ladder.

Release Pin

For safety purposes the ladder is especially needed in hotels, offices, institutions and private homes. The longest ladder to have been installed so far is one 40 meters long at a hotel in Austria.

It is often said, that one is safe when the internal escape routes has been fireproofed with, for instance, plaster. Unfortunately, it is a fact that fire in an escape route can prevent people from reaching safety. Furthermore it is often the smoke and not the fire that kills. A smoke filled escape route is a bad escape route. With a MODUM escape ladder installed in the right places, you will always have a safe escape route.
