

In houses with more than one floor the sleeping rooms are generally on the first floor, and since fires often break out on the ground floor it could be impossible to make an escape via the stairs. In these cases a MODUM escape ladder will ensure a safe escape.

The Escape ladder can be supplied with a safety harness.

If the window opens “the wrong way” the escape ladder can be supplemented with an outdoor step.

The ladder is produced from anodized aluminium and stainless steel, and therefore it is extremely durable in all kinds of weather. It is Tüv approved to a weight of 500 kilos per meter. The ladder is extremely stable. It can be mounted by anyone with minimum skill.

  
S Y S T E M

The MODUM escape ladder can be installed for escape from garrets over the roof.

When folded the ladder is only the size of a drainpipe and it can be supplied in all RAL-colours, so it matches the colour of the house. It can also be supplied so it goes over a cornice, a roof gutter or similar.
